CSE 4304-Data Structures Lab. Winter 2022

Date: September 13, 2022

Target Group: All

Topic: Heap, Heapsort, Priority Queues

# <u>Instructions</u>:

- Task naming format: fullID T01L05 1A.c/CPP

- If you find any issues in problem description/test cases, comment in the google classroom.
- If you find any test case that is tricky that I didn't include but others might forget to handle, please comment! I'll be happy to add.
- Use appropriate comments in your code. This will help you to easily recall the solution in the future.
- Obtained marks will vary based on the efficiency of the solution.
- Modified sections will be marked with BLUE color.

<u>Task-01</u>: Implementing the basic operations of a Heap.

Suppose an arbitrary array of size N is given as input. Your task is to build a max-heap from the set of numbers and sort them using Heap-sort.

Take input as long as you don't get -1. For each test case, show the state of Max-Heap and the Sorted array.

Input	Output
4 1 3 2 16 9 10 14 8 7 -1	Max Heap: 16 14 10 8 7 9 3 2 4 1 Sorted: 16 14 10 9 8 7 4 3 2 1
7 9 6 19 8 17 11 2 5 3 13 -1	Max Heap:19 13 17 9 8 6 11 2 5 3 7 Sorted: 19 17 13 11 9 8 7 6 5 3 2

#### Note:

- STL not Allowed
- Use Separate functions for 'heapify', 'Build\_max\_heap', 'Heap\_sort'.

#### Task 2

Use the Heap that you created in Task 1 and convert it into a 'Min Priority Queue' and implement the following functionalities:

- int Heap\_Minimim(int heap[]): Returns the minimum value.
- 2. int Heap\_extract\_min(int heap[]): Removes the minimum value and returns it.
- 3. Min\_heap\_insert(int value, int heap[]): Inserts the 'value' into the heap and makes necessary arrangements.

#### Input

First line of input will contain a set of numbers. Show the corresponding min-heap for that.

After that the input will be like 'function\_id necessary\_params (if any)'. Show the output and 'state of the heap' after each function call.

Input	Output
70 90 60 190 80 170 110 20 50 30 130 -1	Min Heap: 20 30 60 50 70 170 110 190 90 80 130
1	20 20 30 60 50 70 170 110 190 90 80 130
2	20 30 50 60 90 70 170 110 190 130 80
1	30 30 50 60 90 70 170 110 190 130 80
3 45	30 45 60 90 50 170 110 190 130 80 70
3 47	30 45 47 60 90 50 170 110 190 130 80 70

## Note:

- Assume that, we are using 1-based indexing.

### (Self-study)

C++ has Some built-in functions for performing operations on Queue, Heap/ Priority Queue. Check the following links for better understanding:

Basic STL functions to use queues: <a href="https://www.geeksforgeeks.org/queue-cpp-stl/">https://www.geeksforgeeks.org/queue-cpp-stl/</a>

https://www.geeksforgeeks.org/heap-using-stl-c/

STL function to swap two queues: <a href="https://www.geeksforgeeks.org/queue-swap-cpp-stl/">https://www.geeksforgeeks.org/queue-swap-cpp-stl/</a>

https://www.geeksforgeeks.org/heap-using-stl-c/

#### Task 3:

Mark loves cookies. He wants the sweetness of all his cookies to be greater than the value of K. To do this, Mark repeatedly mixes two cookies with the least sweetness. He creates a special combined cookie with:

Sweetness =  $(1 \times Least \times Lea$ 

He repeats this procedure until all the cookies in his collection have a sweetness  $\geq \mathbf{K}$ 

You are given Mark's cookies. Print the number of operations required to give the cookies a sweetness  $\geq K$  Print -1 if this isn't possible.

## **Input format**

The first line consists of integers  ${\bf N}$  representing the number of cookies, and  ${\bf k}$ -the minimum required sweetness, separated by a space.

The next line contains **N** integers describing the array **A** where  $A_i$  is the sweetness of the i<sup>th</sup> cookie in Mark's collection.

### **Output format**

Output the number of operations that are needed to increase the cookie's sweetness  $> \kappa$ 

Output -1 if this isn't possible.

Sample Input	Sample Output
6 7 12 9 1 3 10 2	2

# **Explanation**

Combine the first two cookies to create a cookie with  $sweetness = 1 \times 1 + 2 \times 2 = 5$ 

After this operation, the cookies are (3, 5, 9, 10, 12)

Then, combine cookies with sweetness and sweetness, to create a cookie with resulting  $sweetness = 1 \times 3 + 2 \times 5 = 13$ 

Now, the cookies are (9, 10, 12, 13).

All the cookies have a sweetness >= 7

Thus, 2 operations are required to increase the sweetness.

<u>Note</u>: You should use *Heap* to solve this problem. Sorting might be another way of solving this problem, but that will take O(nlogn) in the worst case. But Heap can lead us to a linear solution.

### Task 4

Given the description of N meetings i.e start time and end time of the meetings respectively, return the minimum number of conference rooms required to arrange the meetings.

Input	Output
3 0 30 5 10 15 20	2
2 7 10 2 4	1

#### Note:

- 0 < N <= 1000
- You must use priority queue.

### Task 5

You are given an array of integers 'stones' where 'storen[i]' is the weight of the i-th stone.

We are playing a game with the stones. On each turn, we choose the **heaviest two stones** and smash them together. Suppose the heaviest two stones have weights x and y, with x<=y. The result of the smash is:

- If x==y, both stones are destroyed.
- If x!=y, the stone of weight x is destroyed, and the stone of weight y has a new weight (y-x).

At the end of the game, there is at most one stone left. Return the weight of the last remaining stone. If there are no stones left, return 0.

Input	Output	Explanation
2 7 4 1 8 1 -1	1	Combine 7,8. State: (2 4 1 1 1) Combine 2,4. State: (2 1 1 1) Combine 2,1. State: (1 1 1) Combine 1,1. State: (1) That's the value of the last stone.
10 10 10 10 10 -1	10	
10 10 5 10 10 10 -1	5	
50 30 10 40 20 -1	10	
50 30 10 40 60 20 -1	10	

10 50 30 10 40 60 20 0 -1 1 7 5 4 2 2 1 4 8 1 - 1
1754221481 - 1
1
175422148-1 0
3 3 -1 0
1 -1 1
